

JET DIFFUSER

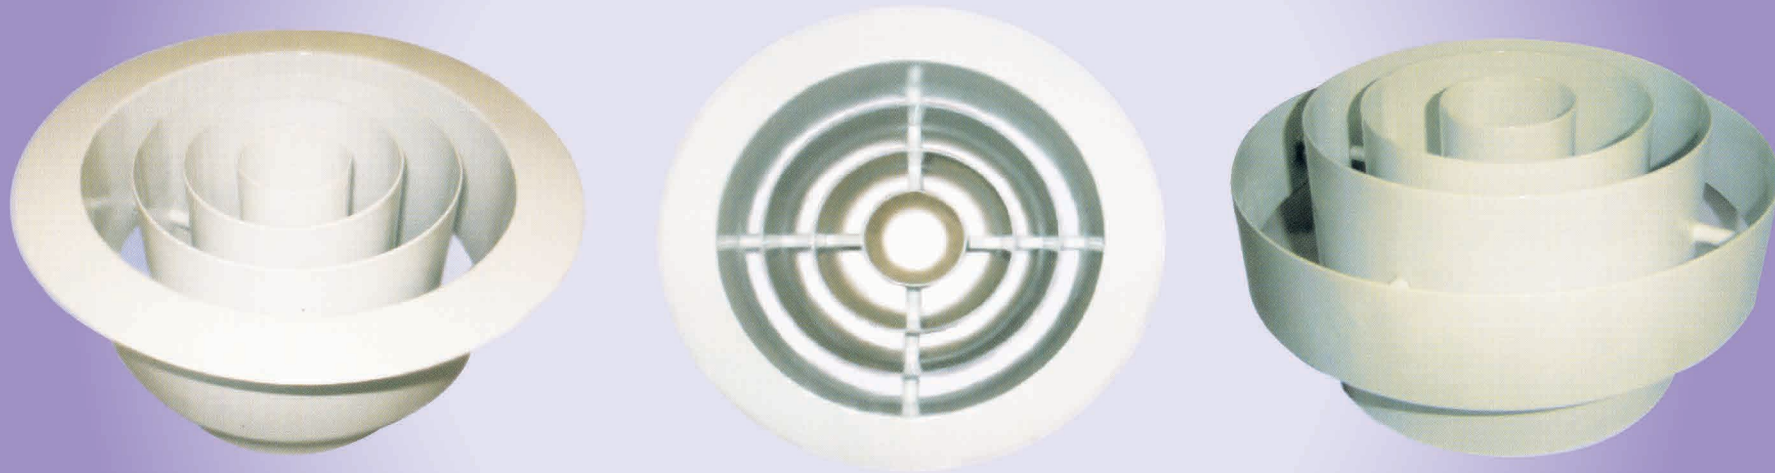

MODUL

AIR DISTRIBUTION EQUIPMENT

Application

The Jet Diffuser have been specially developed to effectively cool, heat, or ventilate large rooms such as theaters convention halls, sport halls, shopping centers, factories, warehouse, exhibition halls, anywhere requiring long or short throws. These diffusers are also recommended with vertical discharge for spot heating or cooling in applications such as entrance ways and concentrated machines areas.

Technical Information

Throw is maximized by converging the air stream through concentric rings into a straight pattern, this reduces the need for extensive ductwork and gives the possibility to reach areas which are unreachable for ductwork.

Construction

Frame : High Quality Mild Steel.
Core : High Quality Mild Steel.
